## 1 1. Part A

$V_N = \{S, L, D\}$   $V_T = \{a, b, c, d, e, f, j\}$   
 $P = \{$   
 $S \rightarrow aS \mid bS \mid cD \mid dL \mid e$   
 $L \rightarrow eL \mid fL \mid jD \mid e$   
 $D \rightarrow eD \mid d \}$

### 1.1 Presentation of five strings that belong to the language $L(G)$

1.  $S \rightarrow dL \rightarrow deL \rightarrow deeL \rightarrow deeeL \rightarrow deeee$

2.  $S \rightarrow aS \rightarrow adL \rightarrow adjD \rightarrow adjeD \rightarrow adjed$

3.  $S \rightarrow cD \rightarrow ceD \rightarrow ceeD \rightarrow ceeeD \rightarrow ceeed$

4.  $S \rightarrow aS \rightarrow aaS \rightarrow aadL \rightarrow aadjD \rightarrow aadjd$

5.  $S \rightarrow aS \rightarrow abS \rightarrow abaS \rightarrow abadL \rightarrow abadeL \rightarrow abadefL \rightarrow abadefe$

## 1.2 Conversion of regular grammar to Finite Automaton

$FA = \{Q, \Sigma, \sigma, S, F\}$   
 $Q = \{S, L, D\}$   
 $F = \{X\}$   
 $\Sigma = \{a, b, c, d, e, f, j\}$

1.  $\sigma(S, a) = \{S\}$
2.  $\sigma(S, b) = \{S\}$
3.  $\sigma(S, c) = \{D\}$
4.  $\sigma(S, d) = \{L\}$
5.  $\sigma(S, e) = \{X\}$
6.  $\sigma(L, e) = \{L\}$
7.  $\sigma(L, f) = \{L\}$
8.  $\sigma(L, j) = \{D\}$
9.  $\sigma(L, e) = \{X\}$
10.  $\sigma(D, e) = \{D\}$
11.  $\sigma(D, d) = \{X\}$

## 1.3 Type of the grammar

The given grammar is of type 3 - right linear, by Chomsky classification, because the productions are only of the type:

- $A \rightarrow xB$
- $A \rightarrow x$
